

Abstract of the Invention

Disclosed is a method of providing a verified test of a student by a test provider at a testing facility remote from the test provider. The method provides the student with a recognizable student identification indicia and the testing facility with a recognizable verification indicia indicative of verification of the student's identity by the facility. Both indicia are required to be entered on a computer terminal at the test facility enabling the student to proceed with the taking of the test at the interactive web site of the test provider, and the test provider is thus assured that the person taking the test is in fact the person who should be taking the test. The process is particularly adapted to providing a traffic school test required by a court.
